

This key should allow you to understand why you choose the option you did (beyond just getting a question right or wrong). More instructions on how to use this key can be found [here](#).

If you have a suggestion to make the keys better, please fill out the short survey [here](#).

Note: This key is auto-generated and may contain issues and/or errors. The keys are reviewed after each exam to ensure grading is done accurately. If there are issues (like duplicate options), they are noted in the offline gradebook. The keys are a work-in-progress to give students as many resources to improve as possible.

1. Is the graph below a linear function?

The solution is yes, the graph is linear., which is option A.

- A. Yes, the graph is linear

* Correct! The graph has a constant rate of change and is thus a linear function.

- B. No, the graph is not linear.

A linear function has a constant rate of growth. As x increases/decreases, y increases/decreases at the same rate. The graph in this example does have a constant rate of change.

General Comment: The equation graphed was $2(x + 2) + 2$. A linear function has a constant rate of growth. This means that as x increases or decreases, y increase or decreases at the same rate. For example, x^2 is NOT a linear function. As x increases, the y increases faster and faster. From $x = 1$ to $x = 2$, the y increases by 3. From $x = 2$ to $x = 3$, the y increases by 5. From $x = 3$ to $x = 4$, the y increases by 7. A linear function would have the same change in y for any change in x .

2. Is the following relation a function?

$$(-4, -48), (-3, -27), (-2, -12), (-1, -3), (0, 0), (1, -3), (2, -12)$$

The solution is Yes, which is option A.

- A. Yes

* Correct! Every x -value has exactly one output.

- B. No

For a relation to be a function, every x -value needs exactly one output. That means for a relation to NOT be a function, we would need one x -value that has two or more different outputs.

General Comment: For a relation to be a function, every x -value needs exactly one output.

3. Is the equation below a linear function?

$$f(x) = 5(x - 5) + 2$$

The solution is yes, the graph is linear., which is option A.

- A. Yes, the equation is linear

* Correct! The equation is a degree-1 polynomial and is thus a linear function.

- B. No, the equation is not linear.

A linear function is a degree-1 polynomial. Polynomial equations have all variables with positive integer exponents.

General Comment: The equation graphed was $5(x - 5) + 2$. A linear function is a degree-1 polynomial. Polynomial equations have all variables with positive integer exponents, like $f(x) = 3x^2 - 2x + 4$. Square root and cube root functions have rational exponents ($1/2$ and $1/3$).

4. Is the following relation a linear function?

x	y
1	-2
2	-4
3	-4
2	2
1	4
0	6
-1	8

The solution is No, which is option B.

- A. Yes

Notice how one x -value has two separate outputs? For a relation to be a function, every x -value needs exactly one output.

- B. No

* Correct! An x -value has two separate outputs and thus this relation is not a function, let alone a linear function.

General Comment: For a relation to be a linear function, every x -value needs exactly one output AND there needs to be a constant rate of growth (as x increases/decreases, y increases/decreases at the same rate).
