

This key should allow you to understand why you choose the option you did (beyond just getting a question right or wrong). More instructions on how to use this key can be found [here](#).

If you have a suggestion to make the keys better, please fill out the short survey [here](#).

Note: This key is auto-generated and may contain issues and/or errors. The keys are reviewed after each exam to ensure grading is done accurately. If there are issues (like duplicate options), they are noted in the offline gradebook. The keys are a work-in-progress to give students as many resources to improve as possible.

1. Is the graph below a linear function?

The solution is no, the graph is not linear., which is option B.

A. Yes, the graph is linear

A linear function has a constant rate of growth. As x increases/decreases, y increases/decreases at the same rate. The graph in this example does not have a constant rate of change.

B. No, the graph is not linear.

* Correct! The graph does not have a constant rate of change and thus is not a linear function.

General Comment: The equation graphed was $5 \left(\frac{1}{2} \right)^{x-2} - 1$. A linear function has a constant rate of growth. This means is NOT a linear function. As x increases, the y increases faster and faster. From $x = 1$ to $x = 2$, the y increases by 3. From $x = 2$ to $x = 3$, the y increases by 5. From $x = 3$ to $x = 4$, the y increases by 7. A linear function would have the same change in y for any change in x .

2. Is the following relation a function?

x	y
1	4.0
2	8.0
3	16.0
4	32.0
5	64.0
6	128.0
7	256.0

The solution is Yes, which is option A.

A. Yes

* Correct! Every x -value has exactly one output.

B. No

For a relation to be a function, every x -value needs exactly one output. That means for a relation to NOT be a function, we would need one x -value that has two or more different outputs.

General Comment: For a relation to be a function, every x -value needs exactly one output.

3. Is the equation below a linear function?

$$f(x) = -4\sqrt[3]{7x+6} - 3$$

The solution is no, the equation is not linear., which is option B.

A. Yes, the equation is linear

A linear equation is a degree-1 polynomial. $-4\sqrt[3]{7x+6}-3$ is a cube root function. No, the equation is not linear.

* Correct! $-4\sqrt[3]{7x+6}-3$ is not a degree-1 polynomial.

General Comment: The equation graphed was $-4\sqrt[3]{7x+6}-3$. A linear function is a degree-1 polynomial. Polynomial equation $= 3x^2 - 2x + 4$. Square root and cube root functions have rational exponents ($1/2$ and $1/3$).

B. Is the following relation a linear function?

x	y
1	2.0
2	2.83
3	-2.83
2	-2.0
1	-2.83
0	-3.46
-1	-4.0

The solution is No, which is option B.

A. Yes

Notice how one x -value has two separate outputs? For a relation to be a function, every x -value needs exactly one output.

B. No

* Correct! An x -value has two separate outputs and thus this relation is not a function, let alone a linear function.

General Comment: For a relation to be a linear function, every x -value needs exactly one output AND there needs to be a constant rate of growth (as x increases/decreases, y increases/decreases at the same rate).
